

Data Binding I

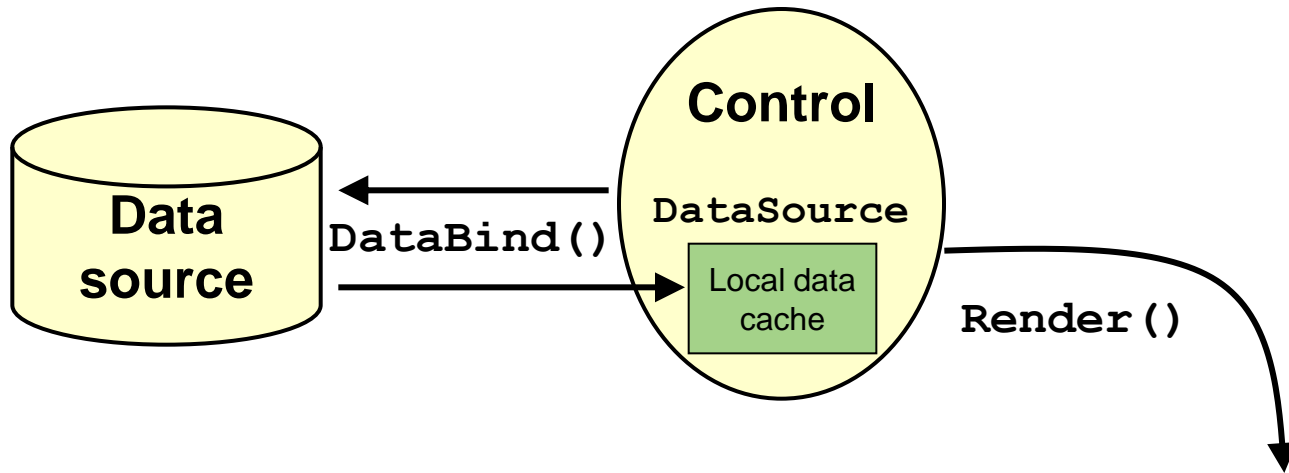

Outline

- **Databinding in ASP.NET**
 - Imperative data binding
 - Controls
- **Page-level binding**
- **Binding text and values**
- **Declarative data sources**
- **SqlDataSource**
- **Connection strings**
- **GridView/DetailsView**
- **Data binding templates**
 - Repeater
 - DataList

Databinding in ASP.NET

- **Data binding is the process of populating a control with data from a data source**
 - Controls that support data binding expose
 - a property called `DataSource`
 - a method called `DataBind()`
 - To bind data to a control imperatively, initialize its `DataSource` to a data source and then invoke its `DataBind()` method

Data binding process

http://patrokus/databinding/datagrid.aspx - Microsoft Internet Explorer

au_id	au_lname	au_fname	phone	address	city
172-32-1176	White	Johnson	408 496-7223	10932 Bigge Rd.	Menlo Park
213-46-8915	Green	Marjorie	415 986-7020	309 63rd St. #411	Oakland
238-95-7766	Carson	Cherylie	415 548-7723	5891 Darwin Ln.	Berkeley
267-41-2394	O'Leary	Michael	408 286-2428	22 Cleveland Av. #14	San Jose
274-80-9391	Straight	Dean	415 834-2919	5420 College Av.	Oakland
341-22-1782	Smith	Meander	913 843-0462	100 Mississippi Dr.	Lawrence
409-56-7008	Bennet	Abraham	415 658-9932	6223 Bateman St.	Berkeley
427-17-2319	Dull	Ann	415 836-7128	3410 Blonde St.	Palo Alto
472-27-2349	Gringlesby	Burt	707 938-6445	PO Box 7923	Covelo
486-29-1786	Locksley	Charlene	415 585-4620	18 Broadway Av.	San Francisco

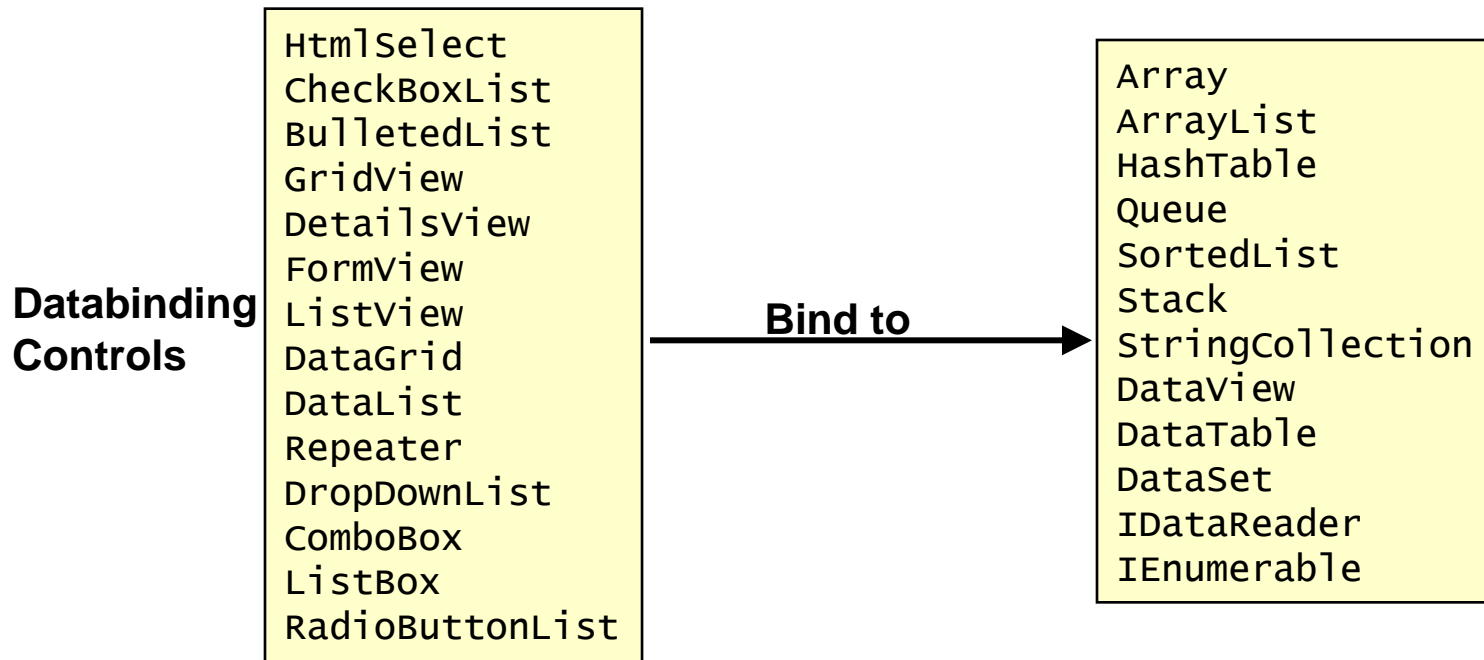

Data binding example

```
<%@Page Language="C#" %>

<html>
<script language="C#" runat="server">
protected void Page_Load(Object src, EventArgs e)
{
    string dsn = "server=.;trusted_connection=yes;database=pubs";
    using (IDbConnection conn = new SqlConnection(dsn))
    {
        IDbCommand cmd = conn.CreateCommand();
        cmd.CommandText = "SELECT * FROM Authors";
        conn.Open();
        IDataReader reader = cmd.ExecuteReader();
        gv1.DataSource = reader;
        gv1.DataBind();
    }
}
</script>
<body>
<form runat=server>
    <asp:GridView id="gv1" runat="server" />
</form>
</body></html>
```

Controls that support Data Binding

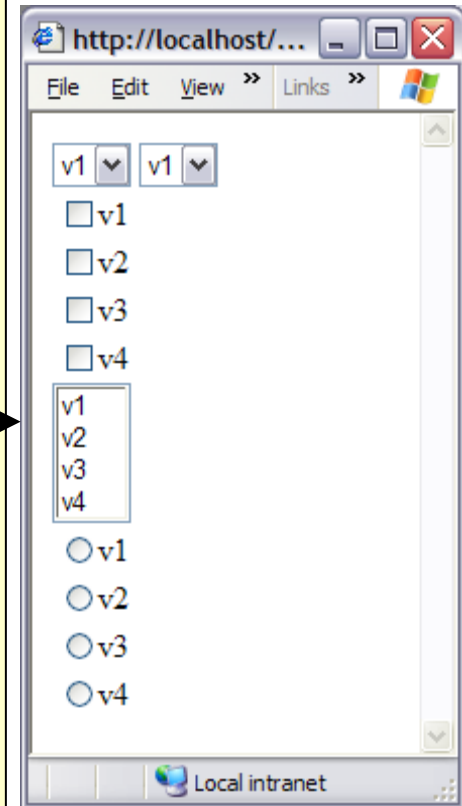

- **Several controls in ASP.NET support data binding**
 - Can be bound to any data source supporting `IEnumerable` as well as `DataTable` and `DataSet` classes

Page-level binding

```
<%@ Page Language="C#" %>
<html><body><head>
<script language="C#" runat="server">
    void Page_Load(Object sender, EventArgs e) {
        if (!Page.IsPostBack) {
            string[] vals = new string[] { "v1", "v2", "v3", "v4" };

            s1.DataSource = vals;
            cb1.DataSource = vals;
            dd1.DataSource = vals;
            lb1.DataSource = vals;
            rb1.DataSource = vals;
            DataBind();
        }
    }
</script></head>
<form runat="server">
    <Select id="s1" runat="server" /> <br/>
    <asp:DropDownList id="dd1" runat="server" /> <br/>
    <asp:CheckBoxList id="cb1" runat="server" /> <br/>
    <asp:ListBox id="lb1" runat="server" /> <br/>
    <asp:RadioButtonList id="rb1" runat="server" /> <br/>
</form></body> </html>
```

Binding Text and Values

- **For single-dimensional controls (ListBox, DropDownList, etc.) bound to rectangular data sources**
 - Initialize `DataTextField` to the field in the query you want displayed
 - Initialize `DataValueField` to the field in the query you want associated with the value of an item

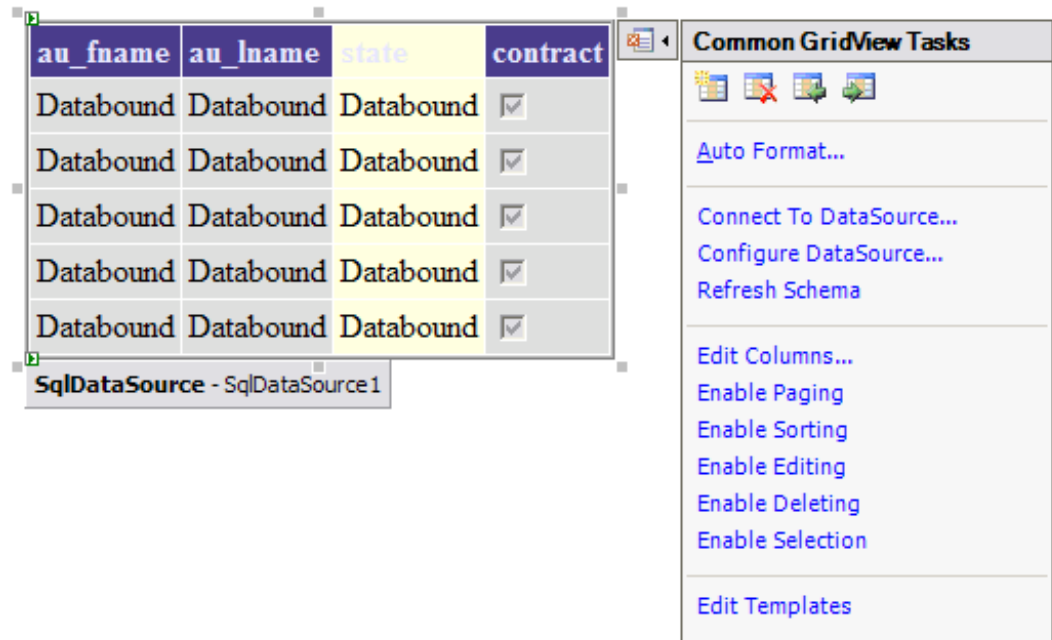

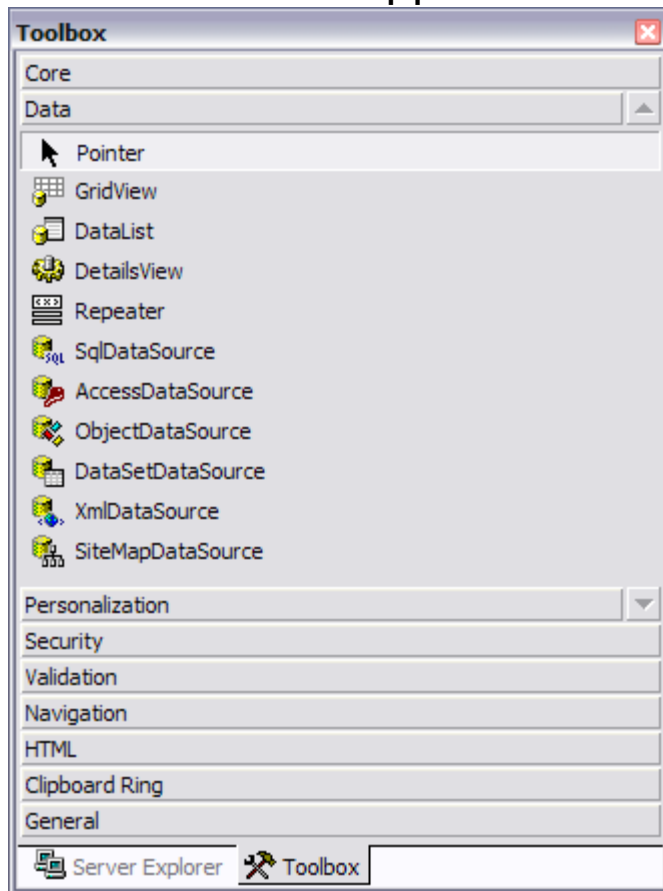

```
string dsn = "server=.;trusted_connection=yes;database=pubs";
string sql = "SELECT au_id, au_lname FROM Authors";

using (SqlConnection conn = new SqlConnection(dsn))
using (SqlCommand cmd = new SqlCommand(sql, conn))
{
    conn.Open();

    dd1.DataSource = cmd.ExecuteReader();
    dd1.DataTextField = "au_lname";
    dd1.DataValueField = "au_id";
    dd1.DataBind();
}
```

Declarative data sources

- **ASP.NET 2.0 introduced the declarative data source**
 - SqlDataSource and friends enable much richer designer support for data-bound controls

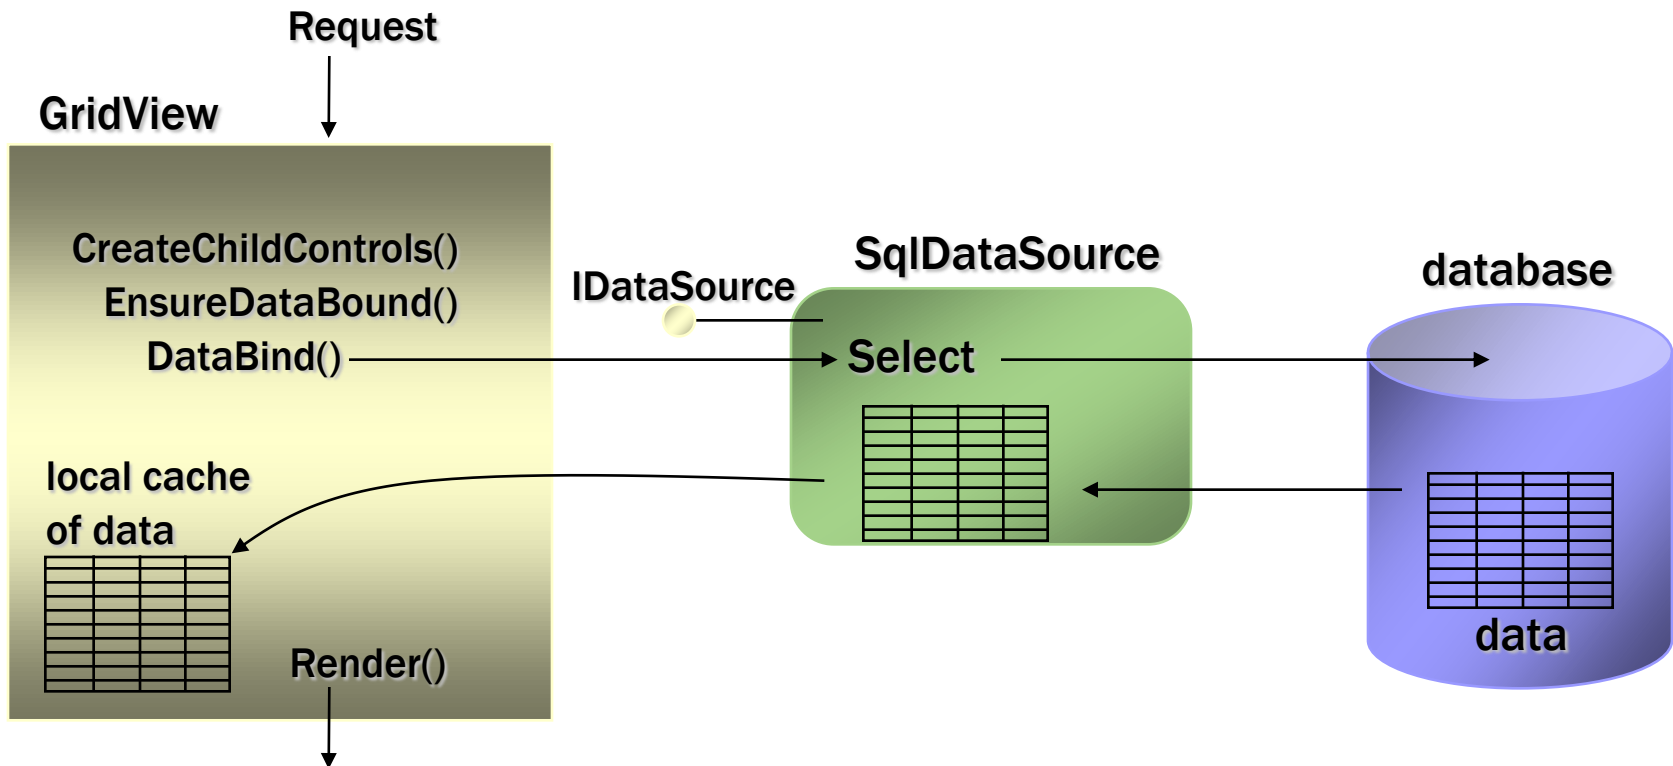

Binding to declarative data sources

- **Data binding can now be accomplished with no code**
 - Extensive designer support
 - Integration with server explorer
 - Standard binding model easily customized

```
<asp:GridView ID="myGridView" runat="Server"
                DataSourceId="pubsDs" />
<asp:SqlDataSource ID="pubsDs" runat="server"
    ConnectionString="server=.;database=pubs;trusted_connection=yes"
    SelectCommand="SELECT * FROM Authors" />
```

How declarative data binding works

<u>title</u>	<u>filed by</u>	<u>assigned to</u>	<u>severity</u>	<u>status</u>	<u>date filed</u>	
Reactor controller times out	Author Pewty	Homer Simpson	Cosmetic	Open	4/25/2005	Details
Icon logo wrong color	Pointy-Haired Boss	Albert Einstein	Disastrous	Open	4/26/2005	Details
Not cat-compliant	Pointy-Haired Boss	Henry Kissenger	Disastrous	Closed	4/5/2005	Details
Needs dangly string	Boss's Cat	Albert Einstein	Embarrassing	Open	4/26/2005	Details
Anon bug # 0	Anonymous Coward	<unassigned>	Pretty serious	Open	3/12/2005	Details
Anon bug # 1	Anonymous Coward	<unassigned>	Pretty serious	Open	3/12/2005	Details
Anon bug # 2	Anonymous Coward	<unassigned>	Pretty serious	Open	3/12/2005	Details
Anon bug # 3	Anonymous Coward	<unassigned>	Pretty serious	Open	3/12/2005	Details
Anon bug # 4	Anonymous Coward	<unassigned>	Pretty serious	Open	3/12/2005	Details
Anon bug # 5	Anonymous Coward	<unassigned>	Pretty serious	Open	3/12/2005	Details

Data binding

- **With data source controls, you no longer explicitly bind data to a control**
 - Occurs implicitly now when child controls are created

```
public abstract class CompositeDataBoundControl : DataBoundControl {  
    protected internal override void CreateChildControls() {  
        //...  
        base.EnsureDataBound();  
        //...  
    }  
}
```

```
public abstract class BaseDataBoundControl : WebControl {  
    protected void EnsureDataBound()  
    {  
        if (this.RequiresDataBinding && (this.DataSourceID.Length > 0))  
            this.DataBind();  
    }  
}
```

SqlDataSource

- **The SqlDataSource is defined for all SQL-based data retrieval / manipulation**
 - ProviderName specifies SQL provider to use (defaults to SqlClient)
 - Supports DataReader and DataSet based retrieval (with caching)
 - Select, Insert, Update, Delete commands each exposed as properties with associated parameter collections
 - FilterExpression with parameters for adding WHERE constraints
 - SortParameterName for adding ORDER BY sort

SqlDataSource control

```
public class SqlDataSource : DataSourceControl
{
    public virtual string ProviderName { get; set; }

    public virtual string ConnectionString { get; set; }
    public SqlDataSourceMode DataSourceMode { get; set; }

    public string SelectCommand { get; set; }
    public ParameterCollection SelectParameters { get; }
    public string InsertCommand { get; set; }
    public ParameterCollection InsertParameters { get; }
    public string UpdateCommand { get; set; }
    public ParameterCollection UpdateParameters { get; }
    public string DeleteCommand { get; set; }
    public ParameterCollection DeleteParameters { get; }

    public string FilterExpression { get; set; }
    public ParameterCollection FilterParameters { get; }
    public string SortParameterName { get; set; }
    // ...
}
```

SqlDataSource example

```
<asp:SqlDataSource ID="patientDataSource" Runat="server"
  UpdateCommand= "UPDATE patients SET firstname = @firstname ...
                  WHERE patientid = @original_patientid"
  InsertCommand="INSERT INTO patients (firstname, ...)
                VALUES (@firstname ...)"
  DeleteCommand="DELETE FROM patients WHERE patientid =
                @original_patientid"
  SelectCommand="SELECT patientid, firstname... FROM patients"
  ConnectionString="...">
  <DeleteParameters>
    <asp:Parameter Type="Int32" Name="patientid"></asp:Parameter>
  </DeleteParameters>
  <UpdateParameters>
    <asp:Parameter Type="String" Name="firstname"></asp:Parameter>
  </UpdateParameters>
  <InsertParameters>
    <asp:Parameter Type="String" Name="firstname"></asp:Parameter>
  </InsertParameters>
</asp:SqlDataSource>
```

Connection string storage

- **Instead of hard-coding connection strings in data source controls prefer to retrieve them from your config file**
 - New ConnectionStrings section
 - New support for encrypting portions of config files
 - New <%\$ %> syntax for retrieving config file values

```
<configuration>
  <appSettings/>
  <connectionStrings>
    <add name="pubs_dsn" connectionString="server=.;..."
        providerName="System.Data.SqlClient"/>
  </connectionStrings>
</configuration>
```

web.config

somepage.aspx

```
<asp:SqlDataSource
  ConnectionString="<%$ ConnectionStrings:pubs_dsn %>"
  ...
```

GridView

- **Renders tabular grid of data**
 - Implicit or explicit column generation
 - Special fields for image/checkbox/hyperlink
 - ImageField
 - CheckBoxField
 - HyperLinkField
 - Intelligent interaction with data source controls
 - Automatic pagination, editing, deleting, and sorting

GridView sample

```
<asp:SqlDataSource ID="authorsDataSource" Runat="server"
    SelectCommand="SELECT ..." InsertCommand="INSERT ..."
    SelectCommand="UPDATE ..." SelectCommand="DELETE ..."
    ConnectionString="<%= ConnectionStrings:pubs_dsn %>" />
<asp:GridView ID="authorsGridView" Runat="server"
    DataSourceID="authorsDataSource"
    EmptyDataText="There are no data records to display."
    AllowPaging="True" AllowSorting="True" />
```

<u>au id</u>	<u>au lname</u>	<u>au fname</u>	<u>phone</u>	<u>address</u>	<u>city</u>	<u>state</u>	<u>zip</u>	<u>contract</u>
172-32-1176	White	Johnson	408 496-7223	10932 Bigge Rd.	Menlo Park	CA	94025	<input type="checkbox"/>
213-46-8915	Blue	Marjorie	415 986-7020	309 63rd St. #411	Oakland	CA	94618	<input checked="" type="checkbox"/>
238-95-7766	Carson	Cheryl	415 548-7723	589 Darwin Ln.	Berkeley	CA	94705	<input checked="" type="checkbox"/>

1 2 3								

DetailsView

- **Supports single-row display/editing**
 - Useful for master/detail scenarios
 - Supports paging, editing, deleting, and *inserting!*

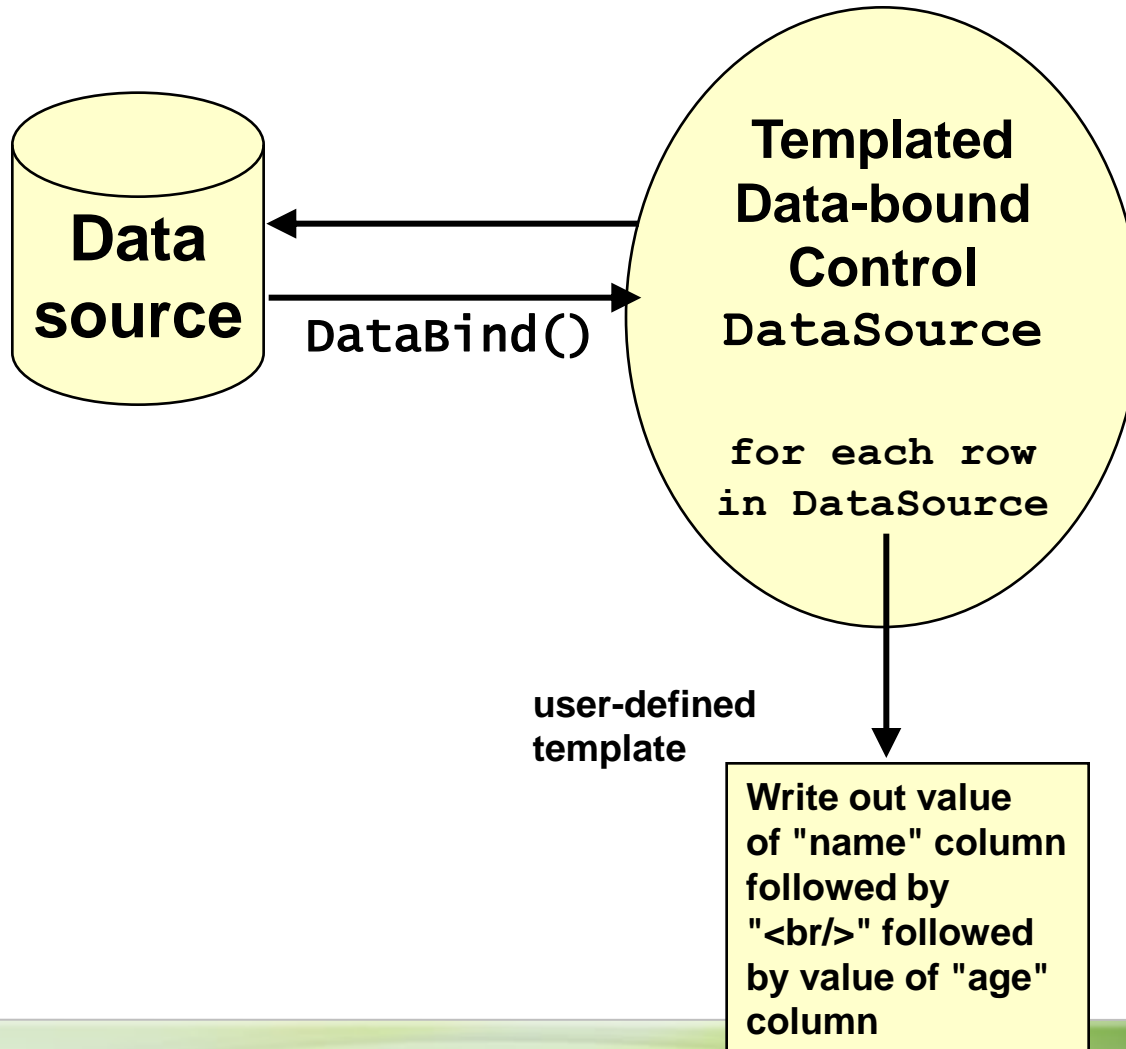

```
<asp:SqlDataSource ID="authorsDataSource" Runat="server"
    SelectCommand="SELECT ..." InsertCommand="INSERT ..."
    SelectCommand="UPDATE ..." SelectCommand="DELETE ..."
    ConnectionString="<%= $ConnectionStrings:pubs_dsn %>" />
<asp:DetailsView ID="authorDetailView" Runat="server"
    DataSourceID="authorsDataSource"
    DefaultMode="edit" />
```

au_id	172-32-1176
au_lname	White
au_fname	Johnson
phone	408 496-7223
address	10932 Bigge Rd.
city	Menlo Park
state	CA
zip	94025
contract	<input type="checkbox"/>

Templates

- **The GridView, DetailsView, FormView, ListView, Repeater, and DataList controls provide complete appearance customization through templates**
 - Provide a shell for displaying data
 - Let you specify exactly how that data should be displayed using a template
 - Handle layout and data binding for you
 - `Eval` syntax used to extract data from current row

Binding Model for Templated Controls

Databinding evaluation syntax

- **Templated controls need a way to specify access to the currently bound row of the data source**
 - Special syntax introduced
`<%# expression %>`
 - Evaluated when the DataBinding event of the containing control is issued (which will be once per row of a data source for data bound controls)
 - `Eval` syntax used to extract column values

Repeater example

```
<asp:Repeater runat="server" ID="rp1" DataSourceID="dogsDataSource">
  <ItemTemplate>
    <%# Eval("Name") %> is a <%# Eval("Breed") %>
    and looks like this:
    <asp:Image runat="server" ID="dogImage"
      ImageUrl='<%# Eval("Image") %>' />
  </ItemTemplate>
</asp:Repeater>
```

Fred is a Dalmation and looks like this:

Fido is a Labrador and looks like this:

Rex is a Golden Retriever and looks like this:

Dal is a Mutt and looks like this:

Joe is a Black Labrador Retriever and looks like this:

DataList

- **The DataList control displays data items in a repeating list**
 - The `DataList` is useful for laying out data items in a list-like format
 - Renders each row in the data source to a single table cell
 - Requires that you define at least an `ItemTemplate` describing how to render each item

DataList example

```
<asp:DataList runat="server" ID="dl1" RepeatColumns="2"
              RepeatDirection="Horizontal" DataSourceID="dogsDataSource">
  <ItemTemplate>
    <div style="padding:15,15,15,15">
      <asp:Image runat="server" ImageUrl='<%# Eval("Image")%>' />
      <br />
      <b>Name: </b><%# Eval("Name") %> <br />
      <b>Breed: </b><%# Eval("Breed") %>
    </div>
  </ItemTemplate>
</asp:DataList>
```

Name: Fred
Breed: Dalmation

Name: Fido
Breed: Labrador

Name: Rex
Breed: Golden Retriever

Name: Dal
Breed: Mutt

Name: Joe
Breed: Black Labrador Retriever

Summary

- **Data binding**
 - Mapping data to controls
- **Declarative data sources**
 - Reduce code, move data access code into framework
- **SqlDataSource**
 - Powerful abstraction over ADO.NET queries
- **Connection strings**
 - Storage location in web.config
- **Data bound controls**
 - GridView, DetailsView, Repeater, DataList
